

Tango Fuego

Manfred Wegel

Tempo needs Tango. With this message printed on his right and left thigh, Friedrich (Friedi) a neighbor boy from Elgersweier cuts an especially impressive figure when leaning into the curves. He promotes the speed of the Tango. Eight-time Baden-Württemberg and Five-time German Champion: at age six in the 50 cc and at age thirteen in the 250 cc class. A real road burner. Note: Huber does not sponsor the motorcycle, but the protective clothing. Safety first.

The tango couple displayed in Offenburg's event hall the „Reithalle“ is almost as fast as Friedi and definitely faster than the photographer's camera thanks to their light-weight protective clothing. The Tango Fuego's fire should not be thought of as promotion for the volunteer fire brigade but for the energy-saving measures of modern clothing techniques and modern temperature control. Calculate a pound of jewelry for every pound of ball dress. Tight fitting clothes save cloth and indirectly reduce unwanted energetic ballast.

The Tango's lightweight ease and the heavy masses of conventional temperature control techniques, which is nothing but ballast, have kept the Tango's pursuers at bay for twenty years. It is important to keep a distance. It can take hours for conventional temperature control units to achieve low temperatures. By contrast when employing the Tango or a big Unistat - frequent international champions with their 500 - 1000 K/h *) - there is often only time for a cup of tea.

Graph Druckula's and Vera Eisberg's tango couples (above) embody energy-conserving dance techniques but tempo is also crucial. The Baden Tango Revolution has produced the temperature control techniques with a minimum of energy and a maximum of speed. And Friedrich leaves them all behind (quoted from the regional newspaper "Offenburger Tageblatt").

*) A bit too much for Ferrari & Co., though we do not calculate in kilometers but in Kelvin per seconds.
